

WATERWAY NOW TESTING HARD SUCTION HOSE

As a new initiative for this year Waterway is now able to offer vacuum testing for hard suction hoses.

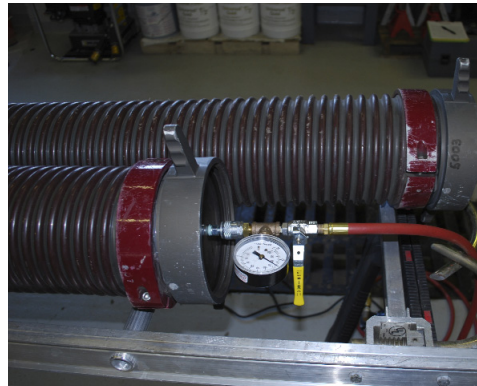

After running a pilot program in 2010 many of the franchisees will be offering this test at selective locations where demand has been identified.

NFPA requires this annual test under Standard 1962 section 7.5. The test does not utilize pressure as with standard hose testing but rather requires a dry vacuum test, which will identify deficiencies including signs of physical damage, collapsing of the inner liner and holes which produce air leaks that can prohibit attaining a prime from draft.
